Position transducer with NOVOPAD non-contacting inductive measurement principle on printed circuit board basis, for direct, accurate measurement of travel in display- or feedback applications.

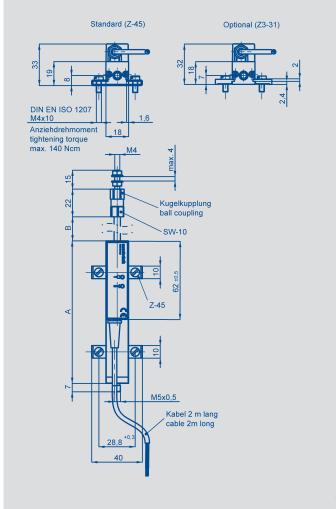

The actuating rod is supported on both ends by slide bearings, allowing high lateral forces on the tip of the rod. The robustness and the compact housing design make the LS1 a reliable solution for industrial environment. A ball coupling enables a backlash- and shear force free operation even with perpendicular or angular misalignment between the transducer axis and the direction of movement.

The integrated signal processor with Teach-In function provides an absolute and proportional current or voltage output signal.

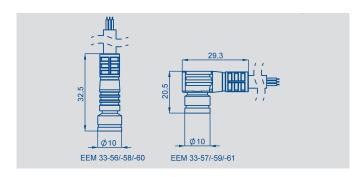

The non-contacting sensors are maintenance and wearfree and convince with an optimal reproducibility, resolution and linearity. The sensor can be exchanged without recalibration. Magnetic fields do not have any effects on the measurement signal.
